

PORTFOLIO WEBSITE

You are required to design and develop a personal web portfolio website that could be presented to prospective employers, clients, or internship providers.

The purpose of the portfolio is to professionally showcase:

- Your technical web development skills,
- Your creativity and design abilities, and
- Your ability to learn independently using online resources.

Your website should act as a digital portfolio that represents you as an aspiring web developer. The design, content, and functionality should reflect your personal style while maintaining a professional appearance suitable for potential employers to review.

You are encouraged to research portfolio trends, explore online tutorials and documentation, and incorporate new techniques beyond those covered in class, where appropriate. Stock standard bootstrap design will not be to your benefit.

Design and develop a responsive multi-section portfolio website using:

- HTML,
 - CSS,
 - JavaScript, and
 - the jQuery library.
-

Read the guidelines given here carefully to make sure your portfolio contains everything required. The portfolio consists of three parts:

- Part A: Initial design,
- Part B: Website, and
- Part C: Reflection.

Part A: Initial design [5]

Before implementing your website – design your website, keeping the web design principles (as investigated for Assignment 1) in mind. You may hand draw your initial design or use a digital tool to create mock-ups.

The focus on the initial designs is not the plan the content of your website – but rather the layout and colour palette. If you plan to create a multi-page website, you do not need initial designs for every page. Your final website does not need to be a perfect recreation of your initial design(s) – but it must be clear that the final website was based on the initial designs.

Part B: Website [50]

At minimum, your website should include the following pages/content:

- Your name, a short introduction, and a profile image/avatar.
- An about me section (biography, skills/interests, education/experience, and career goals).
- Contact form (with a variety of input controls).

You are encouraged to use visual styling that reflects your personal branding to create a unique and eye-catching website. Some helpful tips:

- Experiment with different elements and layout,
- Include JavaScript and jQuery interaction where possible, and
- Look into CSS animation.

You are not restricted to content taught in the module - you are free to use online resources, but you have to ensure everything you do results in a cohesively designed website....and everything works.

Minimum Technical Checklist:

Your website should adhere to the following minimum requirements:

- Semantic HTML,
- External CSS file,
- External JavaScript file,

- jQuery,
- Responsive design,
- Forms,
- Images/icons, and
- Interactive elements.

Part C: Reflection [5]

Alongside your portfolio website, you are required to include a short write-up that details the following:

- Which online resources you used,
- Tutorials/articles referenced,
- New techniques you learned independently, and
- How you adapted online examples into your own design.

Saving your portfolio

Save your portfolio website as follows:

- Create a folder called Portfolio – add any required files or folders to this folder.
- Use appropriate filenames. The home page (with a name of your choosing that makes it obvious that it is the home page, for example, home.html or index.html), and any other appropriately named pages should be saved in the portfolio folder.
- This folder (together with all its contents—files and subfolders) will eventually be downloaded to your lecturer's PC. For this reason make sure that all the links are relative links. If you do not do this, the links will not work when the files are copied and you will lose marks.
- Images relating to the portfolio website should be saved into a subfolder of the portfolio folder called Images (use relative paths when including images – otherwise the images will not be found by the browser – and you will lose marks).
- If the folder structure is not as required you will lose marks.

Submission Instructions

Part A and Part C should be included in the same **PDF** document and submitted to the appropriate submission space on Funda. This PDF, along with Part B (the website) and should be submitted to the appropriate submission space on Funda as **one compressed folder** i.e. you will upload a portfolio folder that contains both your website and the report (Part A and Part C) (saved as a pdf).

Portfolio Evaluation

Portfolios will be assessed using the evaluation sheet after the due date of 5 June. Your portfolio mark will contribute to your final mark.

Initial design

Consideration for web design principles	5
---	---

Website

HTML (structural design and variety in elements)	10
CSS (styling & layout design)	10
JavaScript	10
jQuery	10
Responsiveness	5
Creativity and user experience	5

Reflection

Online research reflection	5
